

Needles and Syringes

High performance products for superior patient care.

**Advance care
with safety
and precision**

Safety and standard pen needles

Our safety and standard pen needles feature thin wall technology for easy flow of medication during injection. The Passive Safety Mechanism on our safety pen needles covers the needle before, during, and after injection and requires no additional steps for activation. They're easy to attach and compatible with most pen injectors available.

Medline Safety Pen Needles

- Safety mechanism covers patient-end needle, reducing chance of needlestick when attached to the pen
- The pen needle is trigger activated and features a red indicator to denote use
- Once activated, the safety mechanism covers the needle on the back end—reducing the chance of needlestick when removed from the pen
- Compatible with most insulin pens including Sanofi Aventis, Lilly, Novo Nordisk, Owen Mumford and Berline Chemie

Standard color coding makes it easy for clinicians to select the right needle gauge

Hypodermic needles
Sturdy regular beveled needles

Blunt tip needles
Standard blunt needles with and without filter

Safety hypodermic products

Nearly one-third of all sharps injuries involve disposable syringes, leading to the transmission of bloodborne viruses that are dangerous to personnel and costly to the healthcare system.¹ The good news is needlesticks are preventable. Medline has variety of easy-to-use safety hypodermic needles to reduce the risk of staff injuries and help improve the safety of your organization.

Needlesticks by the numbers

\$3,000

Estimated cost per needlestick injury²

41%

Estimated portion of needlesticks that occur during use¹

1,000

Estimated number of sharps injuries per day among hospital personnel¹

Scan the code to see our Sure-Snap safety needle in action

Our Sure-Snap™ safety needle and syringe features flip technology that engages a protective shield to cover the needle after it's been used.

Safety insulin syringes and needles

Our safety insulin syringe needles can be temporarily covered by pulling the shield forward; after injection, the shield can be permanently locked in place covering the needle. The shield feature can also be used when you're preparing the syringe in one area for safe transportation to the patient in another area.
